                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A cDNA clone (AAT84485) codes for a mouse novel type alpha-1 (XVIII) collagen (AAW26328) that is expressed in multiple organs, especially the liver, lung and kidney. It was isolated by screening murine 15.5- and 17.5-day embryo libraries with probes based on murine type XII collagen and on human alpha-1 collagen cDNA. Isolated nucleic acids can be used to express recombinant alpha-1 collagen in transformed host cells. Claimed nucleic acid (see AAT84484) coding for human alpha-1 collagen (AAW26527) can be used to treat patients suffering from diseases associated with degradation of cartilage, and for supplementing collagen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid encoding human alpha-1 collagen - for production of recombinant alpha-1 collagen, for use in the treatment of cartilage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3244 ceregagirecacarcacacacidedes

mammalian endostatin. The method comprises identifying a Compound
chaving atomic coordinates with non-trivial similarity to selected
having atomic coordinates with non-trivial similarity to selected
coordinates of atoms of a mammalian endostatin involves (a) providing
coordinates of atomic coordinates of compounds in a library of candidate
compounds, (b) comparing the library of atomic coordinates to the
compounds, (b) comparing the library of atomic coordinates to the
compounds, to comparing the library of atomic coordinates to the
compounds, the candidate compound on the basis of selection
criteria which include similarities between the atomic coordinates of the
confortation. The invention also describes the use of an anti-angiogenic
fragment of endostatin comprising a domain selected from a heparin
c binding domain, a receptor binding domain, and exposed on alpha-helix A
domain, and a carbohydrate recognition domain (CRD) domain. The methods
can be used for designing and selecting endostatin minics. The compounds
identified can be used for treating undesired angiogenesis, e.g. tumours
This sequence encodes human alphal(XVIII) collagen which is used in the
corrections.
                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for identifying mimetics of

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver thumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a cytostatic activity. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression,

It was isolated from a placental CDNA library using a probe based on an unidentified collagenous protein and a probe based on mouse alpha-1 cDNA clone mc19. A claimed plasmid comprising alpha-1 collagen nucleic acid and an expression control sequence can be used to express recombinant collagen in prokaryotic or eukaryotic (especially mammalian) host cells. The collagen may be used to treat a patient suffering from a disease associated with degradation of cartilage, and for supplementing

This invention describes a novel viral gene therapy vector comprising a nucleic acid molecule encoding an anti-angiogenic polypeptide chosen from human or murine angiostatin, human or murine endostatin and angiogenesis-inhibiting fusions and fragments, where the viral vector is sufficiently attenuated for use in human gene therapy. The products of the invention have anti-angiogenic, cytostatic, anti-diabetic and ophthalmological activity. The vector is used in gene therapy for inhibiting tumour growth in humans harbouring a solid tumour. The vector expresses an anti-angiogenic polypeptide. An additional use comprises treatment of diabetic retinopathy, where the anti-angiogenic polypeptide inhibits angiogenesis in the vicinity of the retina. The vector is administered to cells ex vivo and then administered to the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LysProGlyAlaArgIlePheSerPheAspGlyArgAspValLeuGlnHisProAlaTrp

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polyuncleotides 98% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens of ovarian antigens, antibodies against human ovarian antigens, and the use cof ovarian antigen polyuncleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and compassing to metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation.) collycystic ovary syndrome, ovarian cysts, and dysmenorkhoea), endocrine disorders infertions (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, opphoritis and communuodeficiencies, autoimmune ophoritis, systemic lupus erythematosus), conderesting conders, and inflammatosus of programmal, conditions (e.g., anadiovascular disorders, autoimmune ophoritis, gastrointestinal disorders, conders, conditions (e.g., anadiovascular disorders, conditions), cardiovascular disorders, conditions (e.g., anadiovascular disorders, conditions), cardiovascular disorders, conditions (e.g., anadiovascular disorders), conditions (e.g., anadiovascular disorders)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents cDNA encoding a human ovarian antigen of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                a for this patent did not form part of the printer obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and urinary system disorders. Ovarian antigen polypeptides and polynuclectides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynuclectides identification of gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies

The present invention relates to a composition for gene therapy, comprising a DNA encoding an anti-anglogenic protein, which shows therapeutic effects on rheumatoid arthritis. The composition is useful for treating rheumatoid arthritis and the gene therapy is effective, lasting for 14 days. The present sequence is the coding sequence for human collagen XVIII. Endostatin, which consists of the C-terminal 183 residues of collagen XVIII, was used as an anti-angiogenic protein.
                                                                                                                                                                                                                                              4402 TGTGAGACGTGGCGGACGGAGGCTCCCTCGGCCACGGCCAGGCCTCCTCGCTGGCG

                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately stringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polymeptides (ABP68596-ABP68637) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polynucleotides, antibodies, fusion proteins; T cell populations and antigen presenting calls expressing the polypeptide are useful in treating pancratic cancer and stimulating an immune response. The polynucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in the tumour cells, in vaccines and for gene therapy.

The present invention relates to a new method of producing a protein, such as functional protein domain, that is either C or N-terminus of the primary translational product (PTP) of a gene, where the protein has biological activity which is distinct from PTP. The method of the invention involves growing a host cell transfected with a DNA construct comprising a regulatory DNA and a DNA targeting segment. This method is useful for producing a functional protein domain of proteins such as regulatory factors, blood products and monoclonal antibodies. The method castibed in the invention allows controlled and precise modification of the host cell genome in order to produce functional protein domain (PPD). The amount of exogenous sequence to be integrated in the host cell genome itself is used. Use of the host cell genome itself is used. Use of the host cell sequence encoding FPD also provides the advantages of both eliminating equence encoding FPD also provides the advantages of both eliminating and recombination derived alteration of sequence and also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             making use of the same post-transcriptional (e.g., splicing) and/or post-translational (e.g. glycosylation, phosphorylation) processes that are actually applied in vivo for the maturation of FPD. The use of a single regulatory unit eliminates the necessity of manipulating the complementary DNA coding for the PTP to isolate the segment coding for the FPD, and adapt it to the expression vector. The present nucleic acid sequence encodes the plasmid pEnd-HR#1 FPD fusion protein of the invention. The FPD fusion protein contains the mouse Ig signal peptide (mIgSP) sequence fused to exons 38-41 of the human COLIBA1 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Producing functional protein domain by growing host cell transfected with DNA construct having regulatory DNA and DNA targeting segment, and optionally culturing homologously recombinant cell and collecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 900 BP; 146 A; 336 C; 274 G; 144 T; 0 other

The present invention provides the protein and coding sequences of canine pro-endostatin and endostatin. The sequences can be used in the treatment and diagnosis of angiogenesis related disorders, including cancer, rheumatoid arthritis, psoriasis, retinopathy, macular degeneration, corneal graft rejection, nervascular glaucoma, retrolental fibroplasis, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque meovascularisation, telanglectasia, haemophiliac joints, angiofibroma, arteriovenous malformations, ischaemic limb anglogenesis, diabetic neovascularisation, and fractures. The present sequence is the canine
ischaemic limb angiogenesis; diabetic neovascularisation; fracture; cytostatic; antiarthritic; antipsoriatic; antidiabetic; ophthalmological; gynaecological; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                 angiogenesis-related disorder, such as cancers or diabetic retinopathy, encodes an endostatin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 829 BP; 124 A; 314 C; 278 G; 113 T; 0 other;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

// lab_host="DH10B" (Life Technologies) (T1 phage resistant) |
// clone llb="Ull-B-B01" |
// clone llb="Ull-B-B01" |
// note="Organ: e9e; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site-1: EcoR I; Site-2: Not I; Ull-B-B01 is a normalized cDNA library confaining the following tissue(s): fetal e9e; The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oilgo-dr primer containing a Not I site. Double stranded CDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oilgonuclectide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (GT7T3-ECCTATACC: This library was created for the program, Gene Discovery in the Visual System, supported by National Eye magnitude (NEI).

NCI_CGAP_ENL_2 is a cDNA_library containing the following tissue(s): Enchondroma cell line (2 cell lines). The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded CDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand CDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this land and the form in this partic, of Towns
                                                                                                                                                                                                                                                                                                                                                                                                              Contact: Robert Strausberg, Ph.D.
